Novel microbial beta-glucuronidase genes and gene products used as reporter/effector molecule, as diagnostic tool, in positive selection, to target molecules to specific cells and to detect and track linked genes.

Claim 3; Fig 5B; 116pp; English.

The present sequence is a microbial beta-glucuronidase (GUS) protein. GUS genes were obtained from six different genera: Enterobacter/Salmonella, Pseudomonas, Salmonella, Staphylococcus and Thermotoga. Microbial GUS can be used as a reporter/effector molecule for transgenic constructions and in in vitro diagnostic applications. It may also be used to generate sentinel plants that serve as bioindicators of environmental status. It may be used to generate transgenic insects for tracking insect populations or to facilitate the development of a bioassay for compounds that affect molecules critical for insect development (e.g. juvenile hormone). Secreted GUS may also serve as a marker for beneficial fungi destined . Secreted GUS may also serve as a marker for benefic: for release into the environment. In animal systems,

Microbial GUS may also be used in traditional medical diagnostic assays, for drug testing, pharmacokinetic studies, bioavailability studies, diagnosis of diseases and syndromes, following progression of disease or its response to therapy. Microbial GUS has increased thermal stability, high turnover number and enzymatic activity. It is highly specific for the substrate and water soluble, and the

The invention relates to a recombinant DNA construct comprising a CC provide for expression of a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a CC microbial source. The invention also relates to a transformed plant CC comprising the recombinant DNA construct and a method of producing a CC transformed plant having an improved property. The plant is a crop-plant CC such as maize or soybean. The method of producing a transformed plant with the recombinant DNA construct and growing the transformed plant with the complication of the plant properties and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plant, where the improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by production. This sequence represents a bacterial polypeptide used in the growth part of the printed specification or improved galactomannan of conduction. Note: The sequence data for this patent did not format from USPTO at sequence data for this patent did not format from USPTO at sequence data for this patent did not format from USPTO at sequence data for this patent did not format from USPTO at sequence data for this patent did not format from USPTO at sequence data for this patent did not format from USPTO at sequence data for this patent did not format from USPTO at sequence data for this patent did not format from USPTO at sequence data for this patent did not format from USPTO at sequence data for this patent did n
New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

                                                                                                                                   This invention describes a novel secreted form of Bacillus sp. beta-glucuronidase (BoGUS). The microbial BoGUS polypeptide can be used as reporter/effector molecule and as al dagnostic tool. The products of tinvention can be used as markers for transgene constructions, e.g. in plants or insects. They can also be used for the cleavage and detoxification of glucuronides and to examine conjugation patterns of
                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GUS; BoGUS; beta-glucuronidase; secreted; reporter molecule; marker; receptor molecule; diagnostic tool; transgene construction; plant; insect; cleavage; detoxification; glucuronide.
                                                                                                                                                                                                                                                                                                               Claim

The microbial BoGUS polypeptide can be used as reporter/effector molecule and as a diagnostic tool. The products of t invention can be used as markers for transgene constructions, e.g. in plants or insects. They can also be used for the cleavage and detoxification of glucuronides and to examine conjugation patterns of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel secreted form of Bacillus sp. beta-
glucuronidase (BoGUS). The microbial BoGUS polypeptide can be used as
reporter/effector molecule and as a diagnostic tool. The products of
invention can be used as markers for transgene constructions, e.g. ir
plants or insects. They can also be used for the cleavage and
detoxification of glucuronides and to examine conjugation patterns of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GUS; BoGUS; beta-glucuronidase; secreted; reporter molecule; marker; receptor molecule; diagnostic tool; transgene construction; plant; insect; cleavage; detoxification; glucuronide.

The microbial BoGUS polypeptide can be used as reporter/effector molecule and as a diagnostic tool. The products of tinvention can be used as markers for transgene constructions, e.g. in plants or insects. They can also be used for the cleavage and detoxisization of glucuronides and to examine conjugation patterns of
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 602
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated microbial beta-glucuronidase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hormone). Secreted GUS may also serve as a marker for beneficial fungion destined for release into the environment. In animal systems, secreted GUS may be used to achieve extracellular detoxification of glucuronides (e.g. toxin glucuronide) and to examine conjugation patterns of glucuronides. Microbial GUS may also be used in traditional medical diagnostic assays, for drug testing, pharmacokinetic studies, bioavailability studies, diagnosis of disease and syndromes, following progression of disease or its response to therapy. Microbial GUS has increased thermal stability, high turnover number and enzymatic activity. It is highly specific for the substrate and water soluble, and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          genes were obtained from six different genera: Enterobacter/Salmonella, Pseudomonas, Salmonella, Staphylococcus and Thermotoga. Microbial GUS can be used as a reporter/effector molecule for transgenic constructions and in in vitro diagnostic applications. It may also be used to generate sentinel plants that serve as bioindicators of environmental status. It may be used to generate transgenic insects for tracking insect populations or to facilitate the development of a bioassay for compounds that affect molecules critical for insect development (e.g. juvenile hormone). Secreted GUS may also serve as a marker for beneficial fungi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 602
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          substrates are stable
                                                                                                                                                                                                                                                  516

glucuronidase (BoGUS). The microbial BoGUS polypeptide can be used as
reporter/effector molecule and as a diagnostic tool. The products of t
invention can be used as markers for transgene constructions, e.g. in
plants or insects. They can also be used for the cleavage and
detoxification of glucuronides and to examine conjugation patterns of

The present sequence is a microbial beta-glucuronidase (GUS) protein. GUS CG genes were obtained from six different genera: Enterobacter/Salmonella, Estabhylococcus and Thermotoga. Microbial GUS can CC be used as a reporter/effector molecule for transgenic constructions and CC in in vitro diagnostic applications. It may also be used to generate transgenic insects of environmental status. It CC may be used to generate transgenic insects for tracking insect compounds that affect molecules critical for insect development (e.g. juvenile CC that affect molecules critical for insect development (e.g. juvenile CC thornone). Secreted GUS may also serve as a marker for beneficial fungi CC Gustined for release into the environment. In animal systems, secreted GUS may be used to achieve extracellular detoxification of glucuronides (e.g. toxin glucuronide) and to examine conjugation patterns of glucuronides. Microbial GUS may also be used in traditional medical CC diagnostic assays, for drug testing, pharmacokinetic studies, following the status of diagnostic assays, for drug testing, pharmacokinetic studies.
diagnostic assays, for drug testing, pharmacokinetic studies, bicavailability studies, diagnosis of diseases and syndromes, progression of disease or its response to therapy. Microbial (
                                                                                                                                                                                                                                                                                                                                                                                  Novel microbial beta-glucuronidase genes and gene products used as reporter/effector molecule, as diagnostic tool, in positive selection, target molecules to specific cells and to detect and track linked gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Microbial; beta-glucoronidase; GUS; Enterobacter; Salmonella; Pseudomonas; Staphylococcus; Thermotoga; transgenic plant; bioindicator; transgenic insect; marker; glucuronide detoxification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GC genes were obtained from six different general Enterobacter/Salmonella, CC Pseudomonas, Salmonella, Staphylococcus and Thermotoga. Microbial GUS can be used as a reporter/effector molecule for transgenic constructions and CC in in vitro diagnostic applications. It may also be used to generate constructions are sentinel plants that serve as bioindicators of environmental status. It may be used to generate transgenic insects for tracking insect compounds that affect molecules critical for insect development (e.g. juvenile control of a bioassay for compounds that affect molecules critical for insect development (e.g. juvenile control of control of a bioassay for compounds control of c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a polynucleotide for preventing, treating or diagnosing a disease in an individual. The composition or the polypeptide, polynucleotide or RNA precursor, or antibody is useful for diagnosing, preventing or treating diseases (e.g. cell proliferative diseases such as cancer) in an individual. These may also be used for identifying substances capable of binding to or modulating the function of the polypeptide, capable of affecting the function of the corresponding gene, or capable of affecting the cell division cycle or cell cycle progression, preferably mitosis and/or meiosis. The present sequence represents an antagonist of cell cycle progression protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence

                                                                                                                                                                                                                                                                                                              therapeutic protesh that can be encoded by an adeno-associated virus (AAV) vector of the invention. Such vectors comprise a promoter operably positioned upstream of a nucleic acid encoding a biologically-active therapeutic mammalian serpin or cytokine polypeptide, and optionally also include an enhancer sequence and a post-transcriptional regulatory sequence. A recombinant AAV virion comprising the vector, and a mammalian cell (preferably an endothelial, islet, hepatocyte, pancreas, kidney, muscle, spleen, liver, heart, lung, or brain cell) comprising the vector are claimed. A claimed composition comprises the vector, the recombinant AAV virion, AAV viral particles, or the mammalian cell, and is used in cancer, diabetes, autoimmune disease, pancreatic disease or liver disease therapy. The composition is also used in claimed methods for preventing type I diabetes, and for reducing the rate of disease progression of type

AAV is useful in the manufacture of a medicament for treating lysosomal storage disease e.g., mucopolysaccharidoses VII (MPS VII). MPS VII (Sly Syndrome) is due to the deficiency in the lysosomal enzyme beta-glucuronidase (GUS) which aids in the breakdown of glycosaminoglycans (GAGs). AAV is used in gene therapy. The present sequence is murine GUS protein. This sequence is

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57377-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
